

Editorial

Of all the rights of woman, the greatest is to be a mother. God could not be everywhere, therefore he made mothers. The woman existed, but the mother never existed before a child is born.

Physiological process of birth may turn into pathological disaster any moment. Obstetrician must update the scientific knowledge to cope up the situation. Obstetrician has dual role: to ensure wellbeing of mother and fetus and to impart knowledge to future generation. Technology won't replace teachers, but teachers who use technology will probably replace teachers who do not.

Challenge faced by the practicing obstetrician today is to provide medical care to patients by incorporating the valid, new information. The role played by scientific articles in translation

of research into clinical practice need not be emphasized as it is the only scientific path for the update of any speciality. Research work is translated and disseminated into clinical practice through journals. I seek valuable contribution of articles from all the esteemed editorial board members and readers.

I conclude with quotes from the great inventor Louis Pasteur - "Science knows no country, because knowledge belongs to humanity and is the torch which illuminates the world. Science is the highest personification of the nation because that nation will remain the first which carries the furthest the works of thought and intelligence".
